

Update of calibration profile for IceSpy RH

To improve our delivery performance, the current calibration profile for IceSpy RH sensors will be updated from the current profile: **11, 54 and 85 %RH** to follow the Ellab RH profile: **10, 50 and 90 %RH**.

The performance at the old RH profile values will remain the same.

The change will take effect from October 1st, 2025

Any new calibration or re-calibration performed after this date will follow the new profile.

If customers insist on keeping the old profile, this will be possible if specifically ordered and will be invoiced as extra points.

Internal Change Control reference: CC-3276.
